

Notices & Litigation

Phase 2 — Command centre and Notice workspace

Milestone M3 · "one glance for the day; one page per notice" · 6 October 2026 · branch `claude/kind-cerf-jbqu8m`, PR #103

23 / 23

module pages with 0 px sideways
scroll at 390 px

0

axe WCAG 2.1 AA violations on 46
page views (desktop + phone)

39 / 39

command-centre numbers equal to
the list they open

13 / 13

SQL test suites pass (each
migration applied twice)

Database: done. All five Phase 2 migrations were applied to project `gcquafqxbykxbexcdpy` on 6 October 2026 and checked through the app's own access key (\$4). **Still to do:** merge PR #103 so the app that uses them deploys (\$5).

Contents

1. What shipped, by roadmap task
2. Acceptance criteria — results
3. Audit §10 screen findings — status
4. Migrations — applied, and how they were checked
5. Other deploy steps, positions to confirm, follow-ups
6. Screens

1. What shipped, by roadmap task

Task 1 · Notice workspace at /notices/:id

One page per notice replaces the drawer; every list, the bell, Ctrl K and every e-mail link to it. Header facts (form, reference, case, issue date, due chip, priority, owner, stage), the stage rail with skipped stages marked, four figure tiles (amount, explained, short-payment, client documents) and seven tabs:

Tab	What it does
Issues	What the notice alleges, amount, how much the firm's data explains, position, annexures (phone: cards).
Draft reply	Skeleton from the issues, versions, Send for partner review, approve / ask for changes (managers only).
Documents	Notice PDF, portal case folder and uploads together; Ask client with due dates; e-mail and reminders (E12, signed by the sender).
Activity	Every event in plain words (staff, portal sync, sweep) and notes.
Payments	Link the client's DRC-03 by ARN, or record a pre-deposit.
Hearings · Deadlines	Hearing with note; statutory clocks — mark met, override with a reason, export to calendar.

Actions on the page: assign, change stage, log reply / order (pre-filled from the portal), close with a reason / reopen, request documents, extension, fix a hearing, create or link a matter, open on the portal. The primary button is the notice's next step.

Task 2 · Command centre

Six KPI tiles (each a saved filter); Today's plan ranked by deadline × exposure × readiness with a next-best-action button per row and Mine / Team / Unassigned / Review tabs; reply pipeline with median days per stage; autopilot health (sync, failures by reason, alerts mode); next 14 days; exposure by stage (notices and matters linked separately); clients needing attention; Ctrl K search over GSTIN, client, reference, ARN, DIN and case ID. All figures come from one database call over the same views the lists read. New pages: Work queue, Hearings, Calendar.

Task 3 · One stage vocabulary

New → Triaged → Evidence → Waiting on client → Draft → Partner review → Filed → Hearing → Order → Appeal → Closed, held in `notice_stages` and used by notices and matters (foreign keys). Facts move a notice forward (reply logged → Filed, order → Order, documents requested → Waiting on client...), never backwards. Closing always asks a reason; bulk changes can be undone. Older writers that set only the status, or old matter labels, are mapped by triggers.

Task 4 · House style and navigation

Every module page sits in one shell (one header, search, module tabs with counts, Reports menu) and the WS house style; one filter bar with chips; phone card lists; sidebar group "Notices & Litigation" placed near the top with all its pages, one icon in the collapsed rail, a visible close button in the phone drawer. Rebuilt pages: command centre, All notices, Work queue, Hearings, Calendar, notice workspace, Matters list, matter page, Litigation MIS, Clients & sync (with the same sync-health counts as the command centre and a sync log tab), client profile, case folder, Notice summary, GSTIN-wise count, Refunds, DRC-03. Retired: the drawer, the old work queue and eight legacy components.

Also in this phase

- **Bell:** client and notice on each line, what changed (old → new), unread count and highlight, "For me", read state kept per user across computers.
- **Add notice:** PDF first, form picker (sets type, reply window, default priority), owner / priority / FY, live duplicate check, opens the new notice.
- **Alert e-mails:** every alert links to `/notices/<id>` with an Open notice button; internal alerts have no client greeting or double signature; facts shown once; colour by days left; morning and overdue lists linked line by line, overdue grouped by owner; appeal clocks carry the order's facts.
- **Extension 0.5.1:** toolbar popup rebuilt as a "Portal autopilot" — status, stale & failed sync by default, progress, CAPTCHA waiting, Stop, readable errors.
- **Docs:** positions §13–17 (stages, plan ranking, workspace, e-mails, counts), staff SOP rewritten, tests README, CLAUDE.md.

2. Acceptance criteria — results

Criterion	Result	How it was checked
Every dashboard number clickable, with the same count in the list it opens	Met	SQL test <code>test_95_command_centre</code> compares every figure with its list query; the browser pass opened all 39 linked numbers on the command centre (tiles, plan tabs, pipeline, calendar days, exposure, clients) and read the list's count — all equal. Clients & sync, client profile and report counts were checked the same way by their builders.
Any notice opens by URL from an e-mail, and the next action can be done on the page	Met	Alerts link to <code>/notices/<id></code> (tested in <code>test_60_alerts</code>); the workspace's primary button performs the plan's next action (assign, triage, remind, draft, review, log reply, hearing, order / appeal).
No horizontal scroll at 390 px	Met	23 module pages measured at 390 px: 0 px overflow on all.
Accessibility ≥ 95	Met (axe)	axe-core 4.14, WCAG 2.0/2.1 A + AA rules: 0 violations on 46 page views. (Lighthouse itself was not run in this environment; axe is the engine Lighthouse's accessibility score is built on.)
First paint < 1.5 s with 5,000 notices	Met (DB)	<code>test_96_scale</code> : command centre, plan and list queries on 5,000 notices well under budget; pages loaded in ~1.5–2 s in the browser pass including network idle on the local stack.

3. Audit §10 screen findings — status

All screens in the audit were rebuilt or reworked. Each builder reported every finding as fixed, partly fixed or not fixed. The ones not fully fixed:

Area	Partly fixed / open, and why
Matters (80–96)	No "create all" for suggested matters (deliberate: each reviewed); no paper-book builder; hearing reminders T-3/T-1 not yet in the alert engine; matter numbers are max+1 per IST year (needs a DB sequence); appeal opened as a linked matter, no parent column yet; reopen goes to Triaged.
Litigation MIS (100–106)	Interest accrued to date needs the firm's s.50 position; no FY / forum filter until the matters list supports them; age counts from creation (no opened-on date on matters); lifecycle data mixes subject and forum.
Clients & sync (50–54)	"Logging in / waiting for CAPTCHA" per row needs progress from the extension; no scheduled auto-retry; Import updates portal IDs by GSTIN but does not create clients; finding 54-1 (default client passwords) is a separate security task — see §5.
Case folder (60–63)	Refund "appeal by" date not computed (log the order to start the clock); appeal pre-deposit not tied to its DRC-03.
Refunds / DRC-03 (75–77)	The app's open / closed rules are right; the database flags <code>refund_facts.is_closed</code> and <code>drc03_facts.is_closed</code> still need correcting (only old links read them); pre-deposits are linked from the matter page.
Add notice (05)	Fields are not yet read from the PDF — that is Phase 4.
E-mails (120–123)	Done in the database and in the shell code; sent mail needs the edge function redeployed (§5).

4. Migrations — applied 6 October 2026

Run in the Supabase SQL editor on project `gcquafoxbykxbexcdpy`, in this order. Each file is safe to run twice.

#	File (supabase/migrations/)	What it does
1	20261006120000_notice_stages.sql	Stage vocabulary table; stage columns on notices; back-fills every notice's stage from its status; matters on the same keys (old labels mapped); triggers; notice_facts gains stage columns.
2	20261006121000_notice_workspace.sql	Issues, drafts, document requests and payments tables (RLS open to public, as the app needs); uploads on notices; stage moves they imply; e-mail to client (E12).
3	20261006122000_notice_command_centre.sql	Today's plan view, calendar, hearings, the command-centre call and Ctrl K search.
4	20261006123000_notice_email_links.sql	E-mail deep links and readable alerts; bell read state; forms for Add notice; matter hearings on the calendar; APL-01 rule.
5	20261006124000_sync_status_legacy.sql	Sync status falls back to the old sync log for clients the new run ledger has not seen yet (no sync had run since extension 0.5.0): 5 clients never synced instead of 95; 20 failed logins shown.

The old app keeps working until PR #103 is merged: it writes statuses and old matter labels, which the triggers translate.

Checked on live after applying: the check query below returned true on every row; the new tables, views and functions answer through the app's anon key with access rules open to public; every notice has a stage (670 New, 333 Closed); the command centre answers in about 1–1.5 s; the 15-minute alert job keeps succeeding; the morning and weekly alert jobs were dry-run on live data in a transaction that was rolled back, without error. Sync health now reads 95 eligible, 0 synced in 24 h, 5 never synced, 20 failed logins, last good pull 13 September.

Check after running

Run this; every row should read **true**:

```
select 'stages' k, (select count(*) from notice_stages) = 11 ok
union all select 'every notice has a stage', not exists (select 1 from gst_notices where stage is null)
union all select 'workspace tables', to_regclass('public.notice_issues') is not null and to_regclass('public.notice_drafts') is not null
    and to_regclass('public.notice_doc_requests') is not null and to_regclass('public.notice_payments') is not null
union all select 'plan view', to_regclass('public.notice_plan') is not null
union all select 'command centre', (select notices_command_centre(null) ? 'tiles')
union all select 'bell state', to_regclass('public.notice_bell_state') is not null
union all select 'form choices', (select count(*) from notice_form_choices) > 20;
```

5. Other deploy steps, positions to confirm, follow-ups

Deploy steps

- **Merge PR #103** after the migrations, so the app that uses them deploys.
- **Redeploy the send-gst-email edge function** before switching alerts from preview to live. Until then sent mail would use the old e-mail layout (it still works and still links to the notice).
- **Extension 0.5.1:** load the updated `extension/` folder in Chrome (`chrome://extensions` → reload). The app recommends 0.5.1; 0.4.0 remains the minimum.

Positions to confirm (engineering judgement, reversible)

- The stage list and the facts that move a notice forward (positions §13).
- Today's plan ranking weights and readiness per stage (§14).
- Alert colour by days left: ≤ 2 days red, ≤ 7 amber (§16).
- Refunds: an application whose portal status says "Refund Sanctioned" counts as closed; a refund known only from its case folder stays open until the RFD-05 payment advice (a sanction may be partial).

Follow-ups (not in this phase)

- **Security:** new client logins are created with PAN as user ID and GSTIN as password, so anyone who knows a client's GSTIN can log in as that client (`AddClientPage`, `BulkAddClientsDialog`). Queued as a separate task.
- Database: matter number sequence and parent matter, hearing status and purpose, matter opened-on date, refund / DRC-03 closed flags, refund-at-stake kept out of matter exposure.
- Outline buttons' hover colour fails contrast app-wide (white on orange) — a shared design fix.

6. Screens

Local build against demo data; desktop 1440 px (cropped to the top) and phone 390 px.
